Having specified and installed underfloor heating in numerous projects, Stewart Plumbing used Polypipe's underfloor heating system in the renovation of their new offices.

Based on the outskirts of Birmingham, the new offices required an environmentally friendly way to provide an ambient temperature throughout the rooms.

The project required environmentally friendly heating, which Polypipe was able to provide.

Polypipe's underfloor heating systems circulate warm water through a network of pipes to provide consistent temperature throughout the room. The water is heated to a lower temperature than traditional boiler fed central heating systems, and can reduce running costs as well as providing many environmental benefits.

The Overlay™ system is the perfect solution for retrospective installations and renovations as it is installed over the existing floor and is only 18mm in depth, allowing under floor heating to be installed where other underfloor heating systems would require expensive excavation or for the floor to be raised to an unacceptable level.

Stewarts plumbing have installed underfloor heating on many projects and selected Polypipe because of its longstanding reputation of providing high quality and reliable products. Underfloor heating offered Stewart Plumbing a cost efficient solution whilst eliminating the need to work around the pre-existing radiators.

Polypipe have supplied Stewarts Plumbing with many products over the years and by working together, they have come up with the perfect heating solution for many projects.

The project was completed in December 2015.
