### **Terrain Above Ground**

PVC-u above ground drainage systems

### Terrain Above Ground Drainage

Having pioneered the development of solvent-weld systems, Terrain soil & waste products represent the industry benchmark for quality, installation, flexibility and product innovation backed by the highest levels of customer service. Terrain systems include an extensive range of soil & waste drainage products for commercial, industrial, housing and public sector developments, all built on the strength of our Terrain brand. Systems include solvent-weld and Push-Fit options for both soil & waste drainage; overflow, WC pan and trap connectors along with a comprehensive range of adaptors and accessories. Products are available in a range of colours.

- Industry leading range of solvent and Push-Fit soil and waste solutions
- Unique products offer unrivalled installation options
- High quality finish, colour to match all systems
- Suitable for all types of commercial and domestic installations
- Extensive technical experience to support and advise on all aspects of design and installation
- Fully accredited product systems

As you would expect from a market leader our products come with all relevant standards including:

#### Manufacturing Standards

BS 5255:1989 Specification for Thermoplastics Waste Pipe and Fittings

BS 4514:2001 PVC Soil and Ventilation Pipes, Fittings and Accessories

BS EN 1329:2000 Plastic Piping Systems for Soil and Waste Discharge

BS EN 1566:2000 Plastic Piping Systems for Soil and Waste Discharge (Chlorinated)

BS EN 12380 A1 Air Admittance Valve

BS EN 12380 A1 Air Admittance Valve (Pleura System)

BS EN 1366-3 Terrain Firetrap Sleeves and Collars

#### **Quality Management Systems Standards**

EN ISO 9001:2008 Management System

EN ISO14001:2004 Management System

BS OHSAS 18001:2007 Management System

PASS 99:2006 Integrated Management Registration

#### Sustainable Materials

Plastics are among the most researched materials in the world and rapid technological and manufacturing developments made in recent years have allowed for continuous innovation.

Polypipe Terrain pioneered the development of PVC material for the manufacture of drainage pipes and fittings; we remain at the forefront of the industry across the globe with the use of ever-more environmentally friendly materials with no loss of mechanical characteristics.

Utilising a sustainable material composition contributes significantly to an environmentally friendly manufacturing process and gives a finished product that can be recycled in accordance with British Standards.

#### 100 Soil System - PVC-u (solvent-weld)

82, 110 and 160mm PVC-u soil pipes and fittings:

• Wide range of bends, branches and access fittings to meet all application requirements

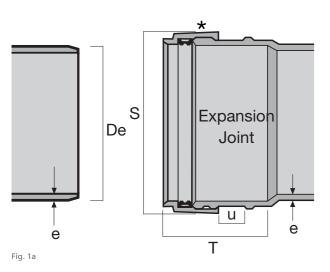

82, 110 and 160mm pipe and fittings (Fig.1)							
А	В	С	T1	T2			
82	95	51	3.2	3.2			
110	122	51	3.2	3.2			
160	175	76	3.3	3.5			

The pipe and socket illustrated here are for solvent weld jointing. The conversion to seal ring expansion joint is made by adding a 109 seal ring adaptor to the socket.

\* Some Terrain fittings feature a groove here, as shown on the underside.

82, 110 and 160mm pipe and fittings (Fig.1a)							
De	S	e (min pipe)	e (min body of fitting)	U	т		
82	102	3.2	3.2	18	72		
110	127	3.2	3.2	19	72		
160	184	3.3	3.5	25	101		

The 109 seal ring adaptor has been drawn in position on the socket of the 100 system fitting to illustrate its application and dimension S. The dimension U is to accommodate all Terrain holderbats.

\* Some Terrain fittings feature a groove here, as shown on the underside.

### 200 Waste System - MuPVC (Solvent-Weld)

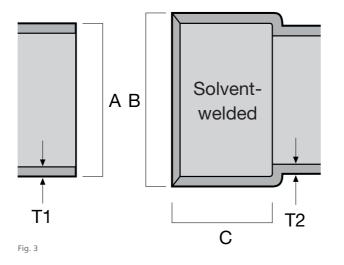

Solvent-weld MuPVC system:

- 32, 40 and 50mm integrated systems
- Wide range of bends and adaptors
- Integrated floor gullies

All Terrain fittings and extrusions are manufactured to BS EN ISO 9001: 2000 certification.

32, 40 and 50mm pipe and fittings (Fig.3)

### 300 Waste System - Polypropylene (Push-Fit)

Push-fit polypropylene system:

- 32, 40 and 50mm integrated systems
- Quick and easy to install
- Saves time and labour costs
- Resistant to most oils, bleaches and detergents
- Wide range of bends and fittings

32, 40 and 5	0mm pipe a	ınd fittings (Fi	g.4)

### 300 Push-Fit

### 400 Traps System

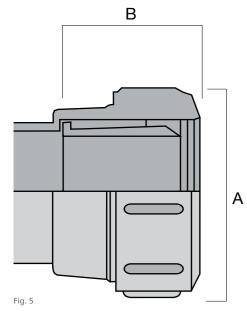

As part of Terrain All Round Drainage Solutions, a comprehensive new range of traps and pan connectors has been introduced. All products are manufactured in the UK and carry the kitemark.

#### Polypropylene traps

- Range of 40 traps
- 32mm & 40mm polypropylene traps
- Premium quality
- Kitemarked
- Manufactured to BS 3943
- Manufactured in the UK
- Pipe stiffener with every trap
- Range includes telescopic and anti siphon traps

#### Pan connectors

- Wide range of 30 pan connectors
- Push-Fit and solvent weld
- Premium quality
- Kitemarked
- Manufactured to BS 3943
- Manufactured in the UK
- Range includes variable degree and offset connectors

## Terrain Pleura System

~

### **Terrain Fire Trap**

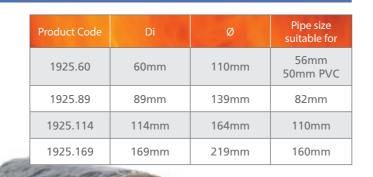

#### Terrain Firetrap Sleeves

- Compatible with all Terrain systems.
- Comprehensively tested to BS EN 1366-3, BS 476P+20. •
- Suitable for vertical and horizontal fire compartmentalisation.
- Quick and easy to install. •

4HR

RATING

- For new installations and retrofit. •
- See Terrain Firetrap brochure for further details.

### Terrain Firetrap Collars - for Terrain PVC Soil and Waste

- Seals against smoke, toxic gases, flames and heat •
- Can be surface mounted or built in .
- Intumescent material is totally unaffected by water, • is robust, 'non-flaking' and difficult to tear
- Powder coated steel outer casing

See Terrain Firetrap brochure for further details.

Product Code	Ø	Fire Rating
1625.55R	50mm	2 Hour
1625.82R	82mm	2 Hour
1625.110R	110mm	2 Hour
1625.160R	160mm	2 Hour
1625.200R	200mm	2 Hour
1625.250R	250mm	2 Hour

### Good Site Practice

- Take all reasonable care when handling PVC-u particularly in very cold conditions when the impact strength of the material is reduced.
- Do not throw or drop pipes, or drag them along hard surfaces.
- In case of mechanical handling, use protective slings and padded supports. Metal chains and hooks should not make contact with the pipe.

#### On-site storage

- Stack pipe lengths
- either on a flat base
- or on level ground
- or on 75mm x 75mm timber at 1 meter centres (Fig. 1)
- Provide side support with 75mm wide battens at 1m centres (Fig. 1).
- Maximum stack (normal conditions): seven layers high.
- Ideally, stacks should contain one diameter pipe size only. Where this is not possible, stack largest diameter pipes at base of stack. Small pipes may be nested inside larger pipes.
- If stored in the open for long periods or exposed to strong sunlight, cover the stack with opaque sheeting.

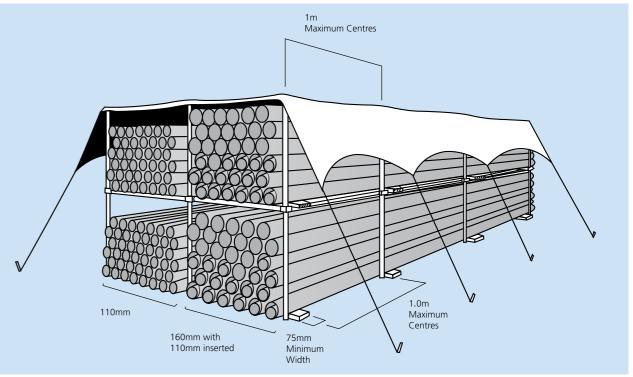

Fig. 1 Pipe stacking

## **General Principles**

- Store fittings under cover. Do not remove from cartons or packaging until required.
- Store solvent cement and cleaning fluid in a cool place out of direct sunlight and away from any heat source.

#### Storage in hot climates

- Ultra-violet light can affect pipes and fittings: pipe colour may change and rubber seals may be degraded.
- Accordingly:
  - store all materials in well-ventilated, shady conditions
  - do NOT expose to direct sunlight
  - keep fittings in original packaging until required for use
- Maximum stack (hot conditions): six layers high.

#### Site safety

- The relevant regulations detailed in the Health & Safety at Work Act 1974, and Construction (Design & Management) Regulations 1995, must be adhered to on site.
- COSHH data sheets are available on request.

#### Sitework Instructions

#### Solvent cement jointing

This technique applies to 100, 200, 400 and 500 pipes when used with 100, 200 and 500 system fittings.

#### Step 1

Cut pipe square, deburr and clean mating surfaces with Terrain cleaning fluid 9101 (Fig.1).

#### Step 2

Coat mating surfaces with solvent cement using a clean brush, assemble joint immediately, removing any excess cement with a clean rag. Initial set 3-minutes. Note 24 hours is required for the joint to fully set before testing. (Fig. 2).

Brush supplied with tin is suitable only for sizes up to 50mm for larger sizes use at least 12mm brush. Directions for use of solvent cement are printed on the container label and must be followed closely.

#### Conversion of solvent weld socket to seal ring joint (using 109 adaptor)

Under normal use only fit 109 to upstream socket.

#### Step 1

Clean mating surfaces with Terrain cleaning fluid 9101 (Fig.3).

#### Step 2

Fit seal ring into 109 collar (Fig. 4)

Step 3

Carefully apply solvent cement to mating surfaces (Fig. 5)

#### Step 4

Assemble immediately applying firm even pressure until collar is in correct position (Fig. 6)

#### Estimating guide: Terrain cleaning fluid, liquid weld, lubricants

Contents Pipe sizes & number of joints achievable*								
		32mm	40mm	50mm	82mm	110mm	160mm	
9101 Cleaning Fluid	125ml	80	80	80	30	20	10	
-	250ml	160	160	160	60	40	20	
9100 Liquid Weld solvent	125ml	27	27	27	10	7	3	
	250ml	55	55	55	20	15	7	
9136 Lubricant	250gm	400	300	250	200	150	100	

\* For guidance only: approximate number allowing for wastage.

Fig. 2

Fig. 3

Fig. 5

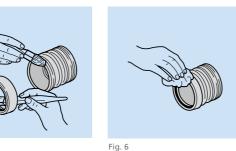

Fig. 4

Seal ring jointing - 109 Step 1

Sitework Instructions

File a 45° chamfer onto end of square cut pipe. Lubricate rubber seal with Terrain lubricant 9136 (Fig.7).

#### Step 2

Enter pipe fully into socket, mark pipe as shown (Fig. 8).

#### Step 3

Withdraw pipe until the mark is 12mm away from socket. This means a 12mm gap exists between the end of the pipe and the socket register. This gap will allow the pipe to expand without distorting the pipework. Anchor the expansion joint with a holderbat or if not practical anchor a fitting within 1 metre of the joint (Fig 9 & 10).

#### Slip coupling - 111.S

Slip couplings are used for inserting additional fittings such as branch or for remedial work in existing soil pipework. To insert fitting:

#### Step 1

Assemble the fitting with a short length of pipe in the appropriate sockets. Cut out a section of the assembly, allowing for an expansion gap. Clean and chamfer pipe ends. Lubricate seals of the slip couplings.

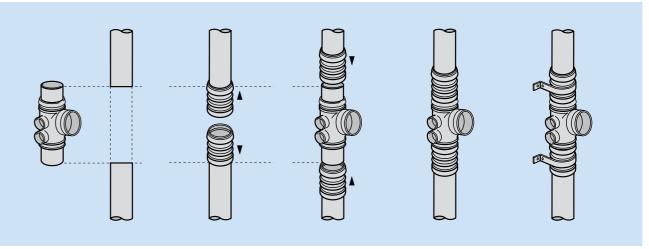

Fig. 11

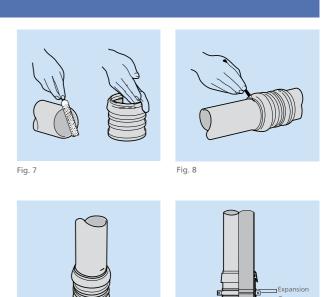

Fig. 9

Fig. 10

#### Step 2

Slide the couplings completely over the spigot ends of the existing pipe.

#### Step 3

Insert and line up the new assembly, slide back the couplings to cover over the joints. Secure slip couplings with holderbats. (See Fig. 11).

#### Control of Thermal Movement - Expansion and Contraction

#### Support and expansion

Plastic pipes expand and contract with changes in temperature. It is therefore essential that expansion joints be provided for the relief of such thermal movement. Any point where a pipe is made good, or fire stopped when passing through a floor or wall, must be treated as a fixed point when arranging the position of expansion joints, but should not be relied on to anchor the pipe unless the socket of a fitting is firmly concreted in. An expansion joint must be fitted between any two fixed points one metre or more apart.

(See Fig. 12) Vertical stacks are generally suported by holderbats anchoring expansion joints. Intermediate holderbats are necessary to steady the pipes.

More frequent support is required in horizontal runs. Maximum distances between expansion joints and holderbats are given in the tables below.

b) At spacing's no greater than 2m for pipework

fig 2

fig 3

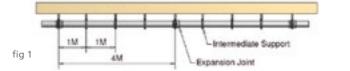

ring seal socket code - 117.125 / 15 / 2

#### Support and Expansion Distances

Unless there is an alternative provision for thermal movement, pipework should be fitted with expansion joints in the following locations:

	Maximum Distance between expansion joint
Pipe Size - Soil	
82mm	4m
110mm	4m
160mm	4m
Pipe Size - Waste	
32mm	2m
40mm	2m
50mm	2m

a) At spacing's no greater than 4m for pipework 82mm and above.

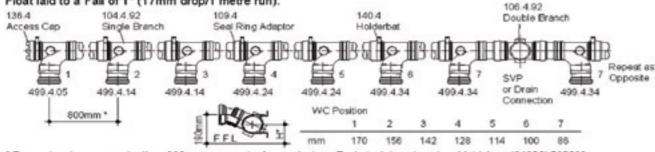

c) Where the maximum distance between fixed points exceeds 1m

d) Any point where pipework passes through a floor or wall and is made good or fire stopped must be treated as a fixed point when determining positions of expansion joints.

e) Low level WC manifolds incorporate ring seal adaptors at each branch connection to compensate for expansion and also allow the branch to be 'turned' to the correct angle to allow connection to the WC

\* For centres less or greater than 800mm see overleaf or contact our Technical department on Maidstone (01622) 795200.

#### **Expansion Joints**

Pipe brackets must be used to anchor expansion joints. The anchor point can be made directly in the bracket grooves provided on pipework fittings or alternatively directly onto the pipe.

When anchoring the pipework using a solvent weld fitting a ring seal adaptor (code 109) needs to be solvent welded to the fitting to accommodate expansion. It is important to lubricate the ring seal adaptor with silicone grease (9136.250)

Anchor points directly onto the pipe can be made using a solvent welded piece (code 9104). The anchor point must be within one metre of the proposed point of anchorage.

Note: On internal pipework systems subject to fire requirements it is recommended that only steel support brackets (code 140) are installed. Intermediate support must also be provided.

Pipework supports shall be provided in accordance with the following tables and either side of bends.

Multiple pipe supports for pipes of differing sizes shall be spaced at intervals required for the smallest pipe

The Thermal Movement Limiter (TML - code 190) prevents the pipe from pulling out of the ring seal adaptor and causing a flood. It will also be necessary to install intermediate support bracket (code 191).

Pipe Material	Pipe SIZE (MM)	Vetical Pipes (m)	Low Gradient Pipes	Pipe Material	Pipe SIZE (MM)	Vetical Pipes (m)	Low Gradient Pipes
MuPVC	32-40	1.2	0.5	PVC-u	32-40	1.2	0.5
	50	1.2	0.9		50	1.2	0.9
					75-100	2.0	1.0
					150	2.0	1.0

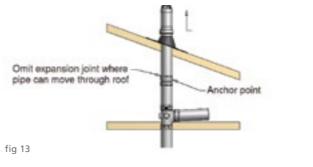

Multiple pipe supports for pipes of differing sizes shall be spaced at intervals required for the smallest pipe.

The Thermal Movement Limiter (TML - code 190) prevents the pipe from pulling out of the ring seal adaptor and causing a flood. It will also be necessary to install intermediate support bracket (code 191).

#### Alternative Provision for Thermal Movement

Expansion joints may be omitted if alternative provision is created in one of the following ways.

a) Above the highest branch connection to a foul and/or waste stack is free to move through a weather proof roof sleeve. (fig 13)

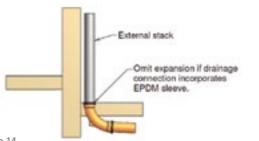

The pipe connecting into the ring seal adaptor should be inserted fully into the socket and marked. To create the expansion gap withdraw the pipe 12mm from the socket. This gap will allow the pipe to expand sufficiently without distorting the pipework. (figs 6,7&8)

- b) At the base of an external drainage stack that is
- connected to a drainage connection that allows movement through an EPDM sleeve. (fig 14)

#### Sitework Instructions

#### Steel holderbat 140

These are designed to clamp fittings, creating a fixed point and to control thermal movement of pipework.

To use holderbats for fittings the strap must fit snugly around the fitting. locate tongue in front of square hole and position strap to suit curvature of fitting. Insert bolt in circular hole and tighten nut (Fig. 14).

For pipe, locate tongue in back square hole and bolt in circular hole and tighten nut. The pipe must be free to move through the holderbat to allow expansion and contraction (Fig. 15). (Alternatively a packing piece 9104 can be used for pipe with the tongue located in the front square hole, as for fittings (Fig. 16).

#### Plastic holderbat 143

This is designed to perform the same two functions as the steel holderbats, i.e. to support pipework and allow thermal movement. When clampled around the socket of a fitting it creates a fixed point (Fig. 17).

#### Adjustable holderbat 144

This is designed to perform the same functions as the other holderbats except it provides up to 28mm of adjustment on the 110mm system. When clamped around the socket of a fitting it creates a fixed point. When used to support pipe it is necessary to locate strap onto inside of back plate (Fig. 18).

Fig. 18(1)

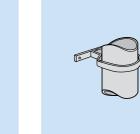

Fig. 15

Fig. 17(2)

Fig. 18(2)

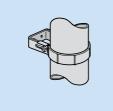

Fig. 18(3)

#### Boss pipes 120 & 123

Only top socket can be converted to seal ring using seal ring adaptor 109.

Lugs permit holderbat anchorage.

120.4 - Accepts 200.125 and 200.15 pipe. (Fig. 22).

Sockets can be converted for expansion using a seal ring adaptor 109.

120.3.2 - Accepts 200.2 pipe and is suplied with blanking plugs that can have the centres removed to accept 200.15. (Fig. 23).

Must be used with engraved arrow pointing downstream to accommodate built in fall of 1<sup>1</sup>/<sub>4</sub>°.

123.4 - Must be used with branch boss adaptors 117 or 117.90. Waste pipe then connects into fitting. (Fig.24)

#### Boss pipe 121

Only the top socket can be converted to seal ring using seal ring adaptor 109.

This boss pipe is for use with bends 207.15.150 allowing the waste pipe to approach at clip distance without the use of offsets. It can be used in both flat (Fig. 26) and corner (Fig.27) situations where pipes approach at 180° and 90° respectively. Solvent weld blanking plug into unused socket.

All bosses will accept 1<sup>1</sup>/<sub>2</sub>" waste pipe, solvent welded direct into the boss pipe.

For 1<sup>1</sup>/<sub>4</sub>" connection a socket reducer 224.15.125 is required. Then use 207.125.150.

NOTE: The letters A, B, and C will be found engraved above each socket on the fitting.

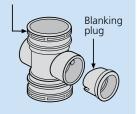

Fig. 22

Fig. 22

Fig. 24

Fig. 25

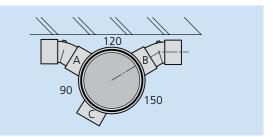

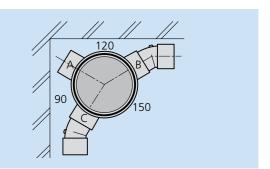

Fig. 26

#### System Connections

#### Connection via universal manifold

Applicable to:

119P Universal Soil Manifold (Fig. 79).119 (solvent connections) and 119P (Push-Fit connections)For 32mm and 40mm waste connection

- For up to four connections of BS EN 1566/ BS EN 1451-1 waste pipe at floor level (e.g. in bathroom) without need for adaptors.
- May be positioned neatly in corner of room for connection to internal soil stack.
- Supplied with four inlets and with removeable plugs.
- A sealing gasket is supplied for each inlet (Push-Fit only). Install as follows:
  - Mark selected position the manifold will occupy on the floor and cut out shape.
  - Push-Fit soil connections to top socket, spigot connection to bottom socket.
  - Remove plug (if present) from selected waste inlet(s).
  - Push-Fit as necessary waste pipe into the manifold until the stop is reached.
  - Check that any waste inlet which is not required has plug in place.

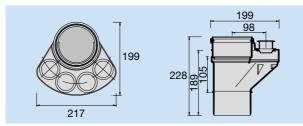

Fig. 79 419.4.15 Universal soil manifold

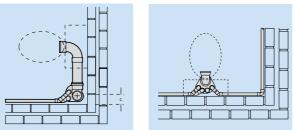

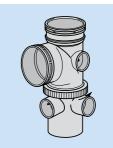

Fig. 80 Internal soil stack connection

Fig. 80 Internal soil stack connection

#### Sitework Instructions

#### Variable boss branch

- Slacken locking ring (Fig. 28).
- Rotate lower unit so that waste connections are in required position (Fig. 29).
- Tighten locking ring (Fig. 30).
- If at ground floor use spigot version push into buried drain lipseal (Fig. 31).
- If at first floor and above use socket version and solvent weld to stack (Fig. 31).
- If only one waste connection is required solvent weld blanking plug into unused socket (Fig.32).
- If 1½" connections are required cut off socket plug at cut guide and use as a reducer (Fig.33).

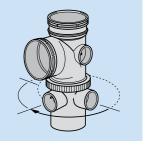

Fig. 28

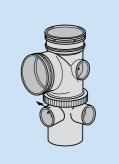

Fig. 29

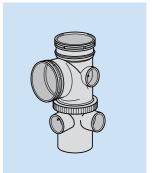

Fig. 30

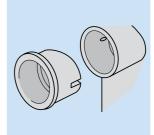

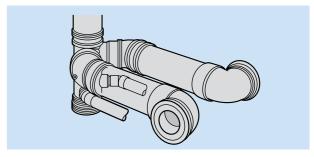

Fig. 32

Fig. 33

Fig. 31

#### **Sitework Instructions**

#### **Boss adaptors**

These accept pipe via a boss ring adaptor, 117 straight or bent.

- Cut out centre of boss. For correct size hole cutter refer to (Fig. 35).
- Remove swarf and clean mating surfaces with Terrain • cleaner 9101 (Fig. 36).
- Apply solvent cement 9100 to all mating surfaces (Fig. 37).
- Position boss adaptor, twist to ensure contact then hold under pressure for a few moments (Fig. 38).
- Remove excess cement (Fig. 39). •

#### Connecting waste pipes to soil stacks via two part boss 112 and adaptor saddle 115P

- Cut correct hole size and deburr (Fig. 40). For correct size hole cutter refer to table below.
- Remove swarf and clean mating surfaces with Terrain cleaner 9101 (Fig. 41).
- Apply solvent cement 9100 to all mating surfaces (Fig. 42).
- Pass inner component outward through hole from the inside of the pipe and push the outer component firmly on to it ensuring that the key and keyway are lined up. Ensure engraving reads: top 911/4 for waste top 88¾ for vent (Fig. 43).
- Insert toggle bolt and screw up until boss is fully closed with flanges in contact with the pipe both inside and outside. (Fig. 44).

NOTE: Leave toggle bolt in position for approximately 15 minutes.

Hole saw sizes				
Aperture diameter (mm)	To suit fitting ref.			
33	281.43			
48	112.4.125 - 135.3 - 112P.4.125			
51	117* - 112P.4.15			
57	112.X.15 - 115P.4			
60	122.4.125 - 112P.4.2			
64	122.4.15			
70	112.X.2			
73	135.4 - 135.6			
75	122.4.2			

\* All sizes.

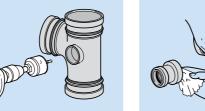

Fig. 35

Fig. 36

Fig. 38

Fig. 40

Fig. 42

Fig. 39

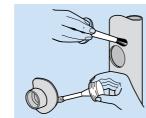

Fig. 44

#### Self locking boss 122

- Cut correct hole size and deburr. For correct size hole cutter refer to table on page 59 (Fig. 45).
- Slacken nut on boss to full extent. Enter boss into hole keeping the keyway to the last piece to enter the hole. Tighten outer locking nut (Fig. 46).
- Once satisfied that the boss fits neatly into the pipe remove and clean all mating surfaces with Terrain cleaner 9101 (Fig. 47).
- Apply solvent cement 9100 to all mating surfaces (Fig. 48).
- Re-enter boss into the pipe. Screw up until hand tight and remove excess cement (Fig. 49).
- Template available ref: 9105.500.

9105.500

#### Access door 135 (110mm & 160mm)

- Set out centre lines as described on inside of access door. Check aperture will be parallel with axis of pipe (Fig. 50).
- Drill two overlapping holes of correct size at 45mm centres (Fig. 51).
- Remove sides of aperture using a medium file (Fig. 52).
- Slacken door to its fullest extent. Push the inner part of the door into the hole at a slight angle turning at the same time. When it is fully entered, turn it parallel to the axix of the pipe ensuring that the inner part locates into the hole. (Fig. 53).
- Ensure seal ring is lubricated prior to fitting. Tighten the screw whilst pulling the door outwards. Do not over tighten (Fig. 54)

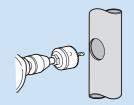

Fig. 45

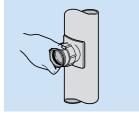

Fig. 46

Fig. 49

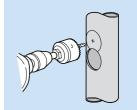

Fig. 51

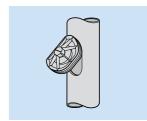

Fig. 53

Fig. 48

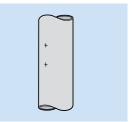

Fig. 50

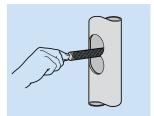

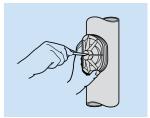

Fig. 52

#### **Sitework Instructions**

#### Weathering slates for pitched roofs 149

- Place 150 Vent Cowl on open end of soil stack (do NOT solvent-weld at this stage) (Fig. 55).
- Slide 149 Weathering Slate over stack (Fig. 56).
- Dress the base plate to fit the lower tiles. Lay the side • and upper tiles over the base plate (Fig. 57).
- Remove the vent cowl. Solvent-weld 131 Weathering Apron to pipe above rubber cone to prevent water ingress. Place 150 Vent Cowl onto stack and solventweld into position (Fig. 58).

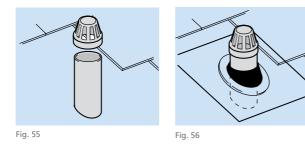

NOTE: On low pitched roofs, optimum weathering may be achieved by making a single weld to the lower edge of the base plate.

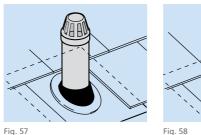

In areas subject to high winds, or in difficult tiling situations, use tingles to prevent lower edge lifting away from tiles.

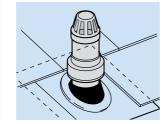

If installing on roof with interlocking tiles, boards or additional battens may be required underneath the weathering slate. The stack must pass through only ONE course (if necessary, the soil stack should be offset beneath the roof).

#### Weathering slates for flat roof (three layers felt) 149

- Dress first layer of felt up to pipe (Fig. 59)
- Place 150 Vent Cowl on open end of soil stack (do NOT solvent-weld at this stage). Slide 149 Weathering Slate over stack. Push slate (and its rubber cone) down onto first layer of felt (Fig. 60)
- Coat the aluminium baseplate with bitumen. • CAUTION: Keep hot material away from rubber cone Place second layer of felt over baseplate up to the cone. Trim accordingly. Repeat for third layer of felt (Fig. 61).
- Solvent weld weathering apron 131 for asphalt to pipe above cone to prevent ingress of water. Replace vent cowl (Fig. 62).

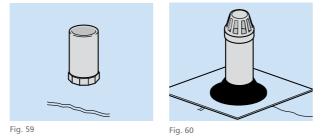

Fig. 48: Vent cowl 150 Weathering apron 131.3.200 or 131.4.200

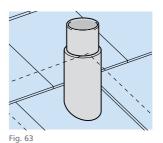

### Sitework Instructions

#### Weathering to pitched roofs using purpose made slate e.g. lead

- Position purpose-made weathering slate on open end of soil stack (Fig. 63).
- Slide 131 Weathering Apron over stack and solventweld in position. Replace vent cowl and solvent-weld into position (Fig. 64).

#### Weathering to asphalt roofs using purpose made slate e.g. lead

- Position purpose-made weathering slate on open end of soil stack. Lay asphalt as normal, over baseplate and to upper rim of lead upstand around pipe. Feather this edge of the asphalt (Fig. 65).
- Slide 131 Weathering Apron over stack and solventweld in position. Place 150 Vent Cowl onto stack and solvent-weld into position (Fig. 66).

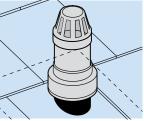

Fig. 64: Vent cowl 150 Weathering apron 131.3.200 or 131.4.200

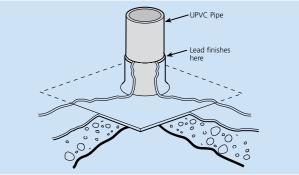

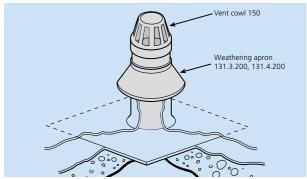

Fig. 65

### System Connections

#### System Planning

#### System connections to below ground drainage

### Connecting to soil system (soil pipe to BS EN 1329)

- 110mm Soil Pipe to 110mm Underground Pipe
   110mm Underground Pipe may be connected directly to 110mm Soil Pipe (Fig. 25)
- A 45° external chamfer should be filed onto the end of square cut soil pipe. The soil pipe is then push-fit into the underground drain ring seal socket, using 9136 Lubricant
- 82mm Soil Pipe to 110mm Underground Pipe (Fig. 26) Connection should be made using the 4DW3 Socket Reducer. The socket reducer is inserted into the plain end of the underground pipe. The 82mm soil pipe is then pushed into top of reducer

### Connecting to waste system (waste pipe to BS EN 1566)

Connection is made using the 124 Socket Reducer. The socket reducer is pushed into the ring seal of the socket on the underground drain pipe. The waste pipe is solvent-welded into reducer. Additional reducers may be used as required.

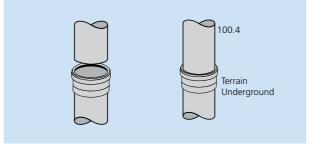

Fig. 25

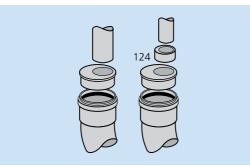

Fig. 26

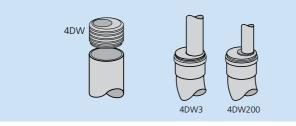

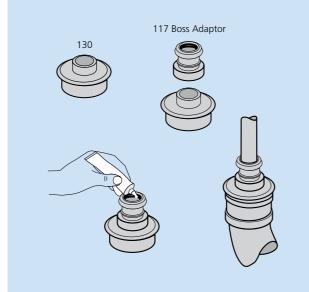

Fig. 27

Fig. 28

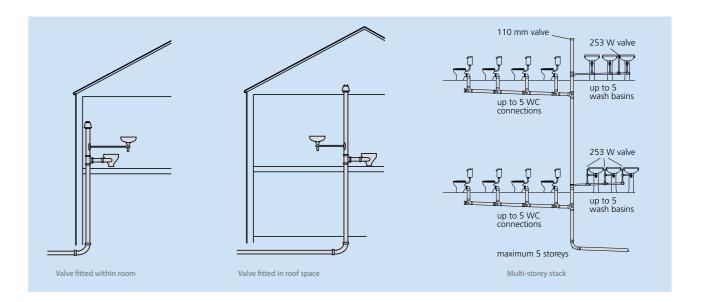

#### System Connections

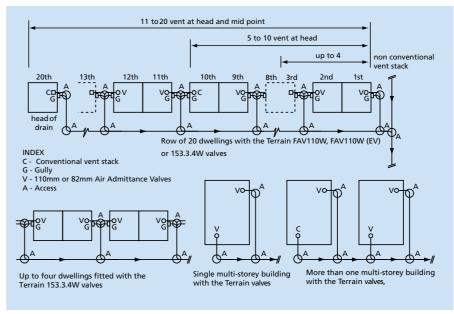

### Automatic air admittance valves 153.3, 153.4 & 253.2

#### Installation

The valve should be fitted vertically and should normally be positioned in the roof space, but if fitted to a WC float or waste branch, must always be positioned above the spill-over level of appliances.

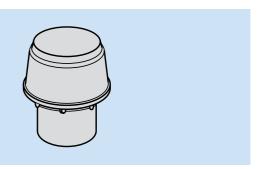

Houses B,C and D may have automatic air admittance valve but house A must have normal S.V.P. to vent head of drain

#### Connecting to BS EN 5255/1566 waste pipe (Fig. 28) (also to copper waste pipe)

The centre of 130 Socket Plug should be drilled out, ready for solvent-weld connection of the appropriate size 4DW Boss Adaptor. Seal rings on 4DW and underground drain socket should be lubricated using 9136 Lubricant.

The socket plug is then inserted into the underground drain socket and 200 Waste Pipe (or copper waste pipe) into 4DW adaptor.

Waste	
32mm round	
40mm round	4DW200
50mm round	

A typical row of dwellings connected to a common drain, with automatic air admittance valves fitted to soil and vent stacks.

NOTE: providing that the head of drain (house A) is open vented, i.e. with S.V.P. then up to 9 houses downstream may be fitted with automatic air admittance valves.

## System Connections

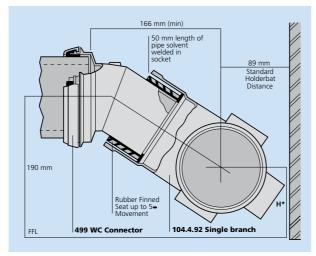

#### System Connections

#### Multiple connection of BS 5503 WC pans

#### Applicable to: 499 WC manifold connectors

Connections to float laid to 1° fall of float (17mm drop per 1 metre run).

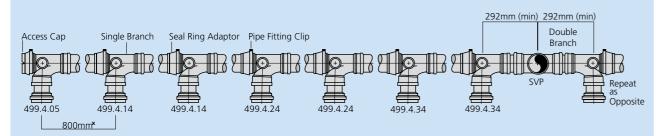

- For minimum dimensions solvent-weld 50mm pipe length into branch socket to provide sleeve.
- NOTE: To extend distance between WC connector and branch, a longer length of pipe may be used.
- Position and fix branch to wall.
- Fit finned rubber seal onto spigot of connector.
- Push spigot of connector into sleeved branch socket (DO NOT LUBRICATE).
- Lubricate rubber seal with 9136 Lubricant to accept WC spigot.
- Align connector socket so that it is square with WC spigot (finned seal allows up to 5° adjustment).

Manifold connector connected to 104 branch

Alternatively float construction can be achieved using 498.4.02.

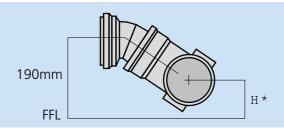

For centres less or greater than 800mm contact Technical Department.

Multiple WC pan connections layout

Distance from finished floor level (FFL) to centre of float				
Connector Type	H* mm (min)	H* mm (max)		
499.4.05	166	176		
499.4.14	142	162		
499.4.24	114	132		
499.4.34	80	100		

\* Variation achieved by flexing rubber finned seal joint.

Distance from finished floor level (FFL) to centre of float

#### System Connections

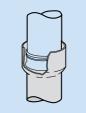

#### Connecting to other materials

#### Connecting to iron, clay or cement fibre spigot

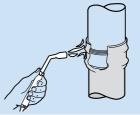

Applicable to: 126 and 226 Adaptors. For soil and waste connections, use with:

9120 Seal Ring for 82mm 9119 Seal Ring for 110mm 9119B Seal Ring for 110mm

• Place rubber seal ring over spigot to half depth of socket (Fig.68).

- Position adaptor centrally Fig. 68 over joint:
  - 126.3.12 Adaptor (for 82mm soil pipe)
  - 126.4.12 Adaptor (for 110mm soil pipe)
  - 226.2 Adaptor (for waste pipe)
- Heat gently with a gas torch/hot air gun, all round the socket starting at the base of the socket and working upwards (Fig. 69).

- When the socket has shrunk down to the adjoining spigot, and the captured seal ring has created a raised ridge, stop applying heat (Fig. 70).
- Leave to cool before moving or applying any pressure.

Fig. 70

#### Connecting to copper

- Clean pipe with 9101 Cleaning Fluid (Fig. 71).
- Replace black seal ring in PVC-u socket with appropriate red seal ring:
  - Seal ring ref. 9149 for 108mm metric copper to BS 2871

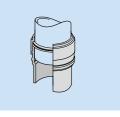

Fig. 71

- Seal ring ref. 9145 for 4" imperial copper to BS 659
- Lubricate seal ring with 9136 Lubricant and insert copper spigot as for standard PVC/PVC seal ring joint (see page 50).

#### Connecting to lead

- Clean pipe with 9101 Cleaning Fluid (Fig. 72).
- Wipe or lead weld short length of copper tube onto end of lead pipe.
- Follow procedure as for copper.

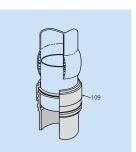

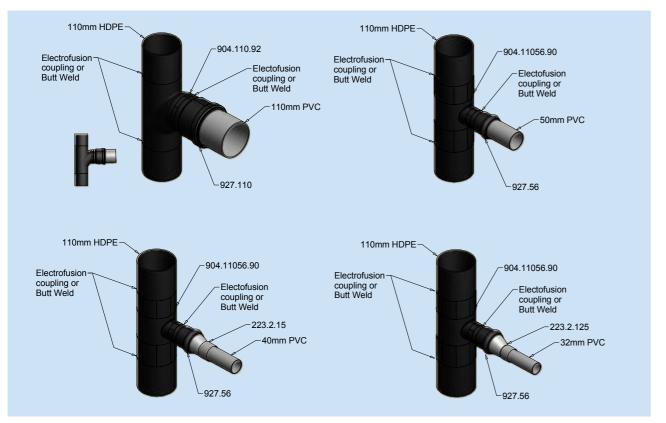

Fig. 72

## System Connections

#### System Connections

#### Connecting to other materials

Connecting PVC to HDPE

#### Trapped floor gullies

#### Installing trapped floor gullies

#### Applicable to:

279/281 Trapped Floor Gully, and 282 and 283 Floor Gully Inlets

- Check overall height of unit with inlet in position, and adjust to suit installation location. (Do NOT solvent weld inlet at this stage) (Fig. 74/75).
- Place gully into position. •
- Solvent-weld waste pipe to outlet socket. •
- Bring floor screed up to level with bottom of gully inlet.
- Allow screed to set, and remove gully inlet. •
- Apply waterproof mastic to underside of square flange • of gully inlet.
- Solvent cement gully inlet into position.
- Tile up to inlet, and grout using waterproof grout. •

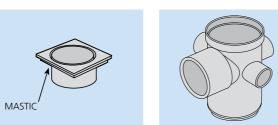

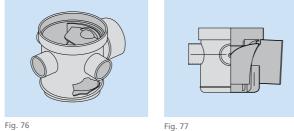

Fig. 74

Fig. 75

System Connections

#### Connecting waste to soil pipework

#### Back to back WC connections

Back-to-back WC's must NEVER be connected using a double branch laid horizontally because cross flow WILL occur .

EITHER

- Run two separate horizontal floats using a corner branch. OR
- Stagger connections on a single float.

Using: 106.490.12, 106.490.22 Corner boss branches

• Use as Fig. 34 (page 55) with 135° bends. Can connect single or a range of WC's on each 110mm branch Lower bosses can connect two 50mm waste pipes directly to sockets or 40 and 32mm pipes using appropriate reducers.

Using standard single branches and 499 WC manifold connectors

See page 61 for details on angles.

- Alternatively, use staggered layout, as shown in Fig. 78.
- Use standard boss connection methods.

#### Making offsets

#### Offsets on-site

Requirement: To offset soil pipe run

- Created on site with a length of 100 soil pipe and 101, 101P, 107 & 107P bends.
- Measure projection required.
- Determine length of pipe required
- Square-cut pipe length and de-burr cut ends. For ring-seal joints, pipe ends must be chamfered.
- Solvent-weld or Push-Fit into standard bend or offset bend sockets

Fig. 77

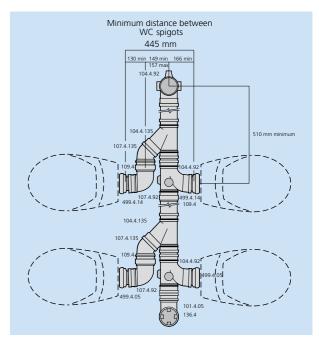

Fig. 78

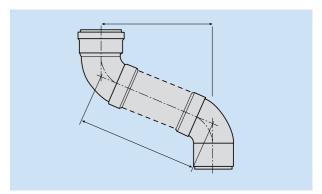

Fig. 82 Offset pipe

## **Balcony Outlets**

# Small Roof Outlets

#### **Balcony Outlets**

#### Installing screed finish balcony outlet

Applicable to: 2172 Balcony Outlet

- Remove grid 1
- Position spacer on locating pegs I.
- Replace screws temporarily to prevent ingress of concrete 1
- Lay screed to the level of the top edge of the spacer 1
- Remove screws and replace grid 1
- Dress flashing over the rear upstand L
- Tuck flashing into brickwork, joint and point 1

#### Installing asphalt finish balcony outlet

Applicable to: 2174 Balcony Outlet

- 1 Remove grid
- Temporarily replace screws to prevent ingress of asphalt 1
- Apply a suitable primer or bonding agent up to engraved Т line on outlet body
- Apply asphalt layer: dress over outer rim and down to 1 engraved line on outlet body
- Remove screws 1
- 1 Offer up grid and check correct angle of dressing
- I Fit washer and grid, and secure with screws

NOTE: The polypropylene washer allows the grid to be easily removed for maintenance/clearing

#### Connection to downpipes

Applicable to: 2172 and 2174 Balcony Outlets

- For 68mm round downpipe (2100): use 2173.3.25 Socket 1 Adaptor
- For 82mm round downpipe (2100.3): connect direct to 1 balcony outlet socket
- Solvent-weld all joints (see page 9) 1

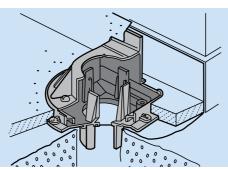

Fig.27

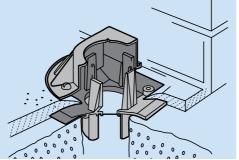

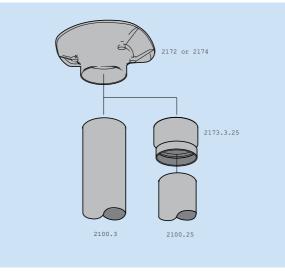

Fig.28

#### **Small Roof Outlets**

#### Fixing small roof outlet to proprietary plastic finish

Applicable to: all 2180 and 2181 Roof Outlets

- I Apply recommended adhesive to flange of outlet body
- I Dress plastic material over flange to the edge of opening
- I Secure the flat or domed grid with brass screw supplied, lightly clamping the roof finish material in position

#### Fixing small roof outlet to mineral felt finish

Applicable to: all 2180 and 2181 Roof Outlets

- I Apply suitable bitumastic primer to flange of outlet body
- I Apply liquid bitumen or activator to roof and prepared area of flange
- I Lay first layer of felt to edge of flange
- 1 Dress second and third layers over the flange to the edge of the opening
- I Secure the flat or domed grid with the brass screw supplied, lightly clamping the edge of the second and third layers of felt

#### NOTE: 2180 and 2181 outlets are not suitable for use with hot asphalt

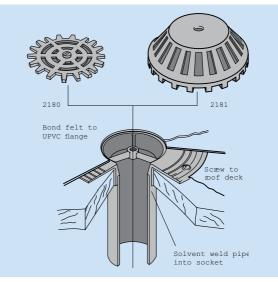

Fig.30

#### Connecting spigot/socket bends (small roof outlets)

Applicable to: all small diameter roof outlet

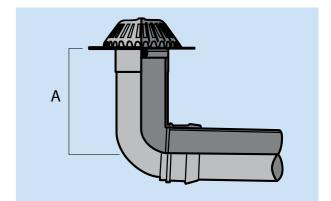

Fig.31 2181.2 Domed Outlet (small diameter)

Fittings	Outlet	Dimension A (mm)	
	size (mm) –		
2180.2 + 207.2.92	55	73	118
2181.2 + 207.2.92	55	73	118
2180.3 + 107.3.92	82	89	168
2181.3 + 107.3.92	82	89	168

### Large Roof Outlets

#### Grid Options

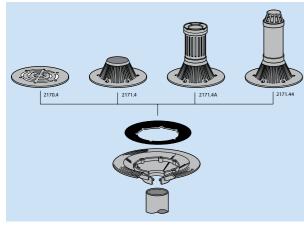

Fig.32

#### NOTE: 2170 flat roof outlet is not suitable for vehicular traffic

#### Fixing to asphalt finish

Applicable to: all 2170 and 2171 Roof Outlets

- I Apply suitable bitumastic primer or bonding agent to bowl and flange of outlet body
- I Dress a 19mm layer of asphalt over flange and bowl to level of upstand
- I Offer up selected grid (see Fig.32 for alternative grids) check correct angle of dressing and engagement of screws
- I Secure grid and washer in position with screws supplied

### NOTE: The polypropylene washer allows the grid to be easily removed for maintenance/clearing

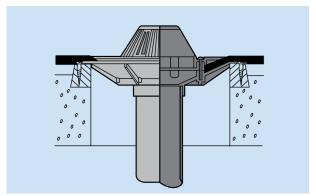

Fig.33 2171.4 Domed Outlet

#### Fixing to mineral felt finish

Applicable to: all 2170 and 2171 Roof Outlets

- Apply suitable bitumastic primer or bonding agent to bowl and flange of outlet body
- I Apply liquid bitumen or activator to roof and prepared areas of outlet body
- I Lay first layer of felt to edge of flange
- I Lay second and third layers over roof outlet
- I Dress down into bowl to the upstand
- I Secure grid and washer in position with screws supplied

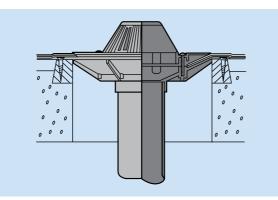

Fig.34 2171.4 Domed Outlet

#### Fixing to proprietary plastic finish

Applicable to: all 2170 and 2171 Roof Outlets

- I Apply recommended adhesive to bowl and flange of outlet body
- I Lay plastic material over roof outlet
- I Dress over flange and bowl to the level of the upstand
- Secure grid and washer with screws supplied (see Fig.32 for alternative grids)

### NOTE: The polypropylene washer allows the grid to be easily removed for maintenance/clearing

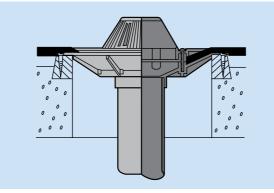

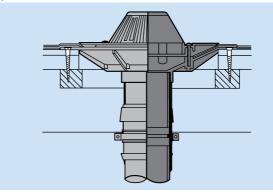

Fig.35 2171.4 Domed Outlet

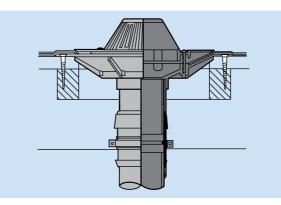

#### Large Roof Outlets

#### Anchoring on thin or uneven roof structures

Applicable to: all 2170 and 2171 Roof Outlets

Three-layer felt on insulation material over profiled metal decking

Three-layer felt on thin timber decking

### Connecting spigot/socket bends (large roof outlets)

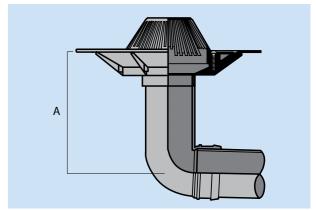

Fig.37 2171.4 Domed Outlet

Applicable to: all large roof outlets

Fittings	Outlet	Dimension A (mm)	
, in the second s	size (mm) -		max
2170.3 + 107.3.92	82	140	219
2171.3 + 107.3.92	82	140	219
2170.4 + 107.4.92	110	146	257
2171.4 + 107.4.92	110	146	257

#### General fixing details

Applicable to: balcony and roof outlets

- Solvent weld pipe-end, or spigot of bend, to roof outlet (for jointing techniques, refer to sitework instructions)
- I Locate outlet body in roof structure and check that a suitable rigid fixing can be made
- I Screw down outlet firmly to roof structure
- I Remove grid
- I Apply selected roof finish

## **Design Considerations**

#### Design Considerations - Above Ground Drainage

#### **Building regulations requirements**

All sanitary pipework and drainage installations must satisfy the relevant requirements of Part H of the approved documents to the England, Wales and Northern Ireland Building Regulations and the Building (Scotland) Regulations 2004.

Installations in accordance with BS EN 12056:2 Code of practice for sanitary pipework will also meet Building Regulations requirements.

#### Ventilation

The discharge stack must be ventilated in order to prevent pressure building up within the system and drawing the water seals in the traps. Separate ventilation of branch pipes is required only if the length and slope of the branch exceeds the following dimensions:

- Maximum length:
- (32mm) 1.7 metres
- (40mm) 3 metres
- (50mm) 4 metres
- Slope: 18-90mm per metre

In such cases, the branch pipe should be ventilated by a branch ventilating pipe or an anti-syphon trap should be fitted. The Automatic Air Admittance Valve reduces the number of stack ventilating pipes required to penetrate the roof in multi-installations, without affecting performance of the drainage system.

#### Thermal expansion

Within a solvent-weld system it is important to make adequate allowance for thermal movement. This is most easily achieved by fitting an expansion ring seal joint between two fixed solvent-weld joints. The expansion gap should be created by pushing the spigot fully into the ring seal socket, and marking the position at the socket face. Then withdraw the spigot by 10mm. Check subsequently to ensure that the expansion gap is not lost during further installation work.

#### Branch connections

The distance between the centreline of the lowest branch connection to the discharge stack and the invert of the bend at the foot of the stack should be in accordance with the following:

- ≤3 storeys 450mm min.
- ≤5 storeys 750mm min.

- 5 storeys + Ground floor connections should discharge direct to drain or into their own stack
- 20 storeys + Ground floor and first floor connections
   should discharge into their own stack

A branch pipe should not discharge into a stack in a way which could cause crossflow into any other branch pipe.

#### Working temperatures

Terrain Soil and Waste systems may be used to convey liquids with a maximum temperature of 76°C when subjected to continuous flow. Intermittent discharges of up to 100°C may occur provided they are of less than 2 minutes duration.

#### Chemical discharges

Terrain Soil and Waste systems are generally resistant to most commonly used acids and those that may be discharged to the public sewer system. The rubber seals, however, are less resistant and it is advised that before any chemicals are conveyed through the systems, checks are made to establish their effects on the product. Refer to BS CP 312 Part 1 Code of Practice for Plastic Pipework for further information.

#### Access

Sufficient and suitable access must be provided to enable all pipework to be tested and maintained effectively. Access covers, plugs or caps should be installed in positions to facilitate use of testing equipment and removal of blockages.

#### Fire spread

In large commercial or housing developments, compartmentation may be required by the Building Regulations 2010 (Part B). In such cases, any penetrations by sanitary pipework must be suitably fire stopped. Suitable measures include the containment of pipes from floor to ceiling in a fire resistant enclosure (with appropriate fire rating).

#### Pipe support

Pipes must be adequately supported when installed vertically or horizontally (to falls).

#### Notes:

#### 1. Gradients

Gradients should be between 1 and 5 degrees with a maximum distance of 3 metres. Distances over 3 metres are prone to blockage and should therefore be provided with access (Terrain Reference 204.15.135 & 237.15).

#### 2. Venting

Maximum distance from stack for unvented system is 1.7 metres according to angle (see diagram A for details). Above 1.7 metres, venting is required, and if this is impractical then a suitable re-sealing trap (415.15) should be used.

#### 3a. Air Admittance Valves

Air admittance valves (Terrain ref. 153.4.3) may be fitted as an alternative to an open vent, however an open vent must be allowed at the head of a drain. For further details see agreement Certificate No 06/4343.

#### 3b. Terrain Pleura

Terrain Pleura may be fitted as an alternative ventilation system. The Pleura 50 protects the fixtures connected to the branch drain with the Pleura 100 and the PAPA together protecting the stack against positive and negative air pressures. An open vent must be allowed at the head of the drain. For further details see BBA Certificate 89/2139.

#### 4. W.C. Connectors

W.C. connectors shown are to horizontal outlet pans (to BSEN997). For traditional P and S outlets a Terrain 495.4.5 or 492.4.5 connector should be used.

#### 5. Stub Stacks

Stub stacks are used to connect one set of domestic appliances. A to be maximum of 2.0 metres and B (to crown of W.C. trap) to be maximum of 1.5 metres.

#### 6. Connection Zones

Although four bosses have been provided on branches and access pipes certain connections are not allowed under BS5572. For permitted connections, see diagrams.

#### 7. Distances

Distance must be a minimum of 450mm for single houses up to 3 storeys, or a minimum of 750mm up to 5 storeys, or one storey height for 5 storey buildings and over. Minimum radius of bend 200mm or alternative of 2 No. 45 degree bends.

#### 8. Support and Expansion

Expansion should be allowed every 4.0 metres for 82mm, 110mm and 160mm and 2.0mtrs for 36mm, 43mm & 56mm respectively both vertically and horizontally.

### Design Data - Soil & Waste

#### Table A: Discharge units (DU) Values

Appliance	System III DU I/s
Wash basin, bidet	0.3
Shower without plug	0.4
Shower with plug	1.3
Single urinal with cistern	0.4
Urinal with flushing valve	-
Slab urinal	0.2*
Bath	1.3
Kitchen sink	1.3
Dishwasher (household)	0.2
Washing machine up to 6kg	0.6
Washing machine up to 12Kg	1.2
WC with 4.0L cistern	**
WC with 6.0L cistern	1.2 to 1.7***
WC with 7.5L cistern	1.4 to 1.8***
WC with 9.0L cistern	1.6 to 2.0***
Floor gully DN 50	-
Floor gully DN 70	-
Floor gully DN 100	-

\* Per person.

- \*\* Not permitted.
- \*\*\* Depending upon type (valid for WC's with siphon flush cistern only).
- Not used or no data

#### Table B: Typical frequency factors (K)

Usage of appliances	К
Intermittent use, e.g. in dwelling, guest- house, office	0.5
Frequent use, e.g. in hospital, school, restaurant, hotel	0.7
Congestred use, e.g. in toilets and/or showers open to public	1.0
Special use, e.g. laboratory	1.2

See Table C and D for capacities of pipes.

#### Frequency factor (K)

Typical frequency factors associated with different usage of appliances Table B.

Calculation of flowrate Waste water flowrate (Qww)

Qww is the expected flowrate of waste water in a part or in the whole drainage system where only domestic sanitary appliances are connected to the system

Qww = K√∑DU

where:

Qww = Waste water flowrate (L/s)

= Frequency factor Κ

= Sum of discharge units. ΣDU

NB: Under no circumstances should pipe of a larger diameter be connected to pipe of a smaller diameter in the direction of flow.

#### Table C: Stack with only Primary Vent

Stack & Stack Vent	System I, II, III, IV Q max (L/s)		
DN	Square # entries	Swept entries	
60	0.5	0.7	
70	1.5	2.0	
80*	2.0	2.6	
90*	2.7	3.5	
100**	4.0	5.2	
125	5.8	7.6	
150	9.5	12.4	
200	16.0	21.0	

Minimum size where WC's are connected in system II

\*\* Minimum size where WC's are connected in system I, III, IV. # Equal branch junctions that are more than 45°, or has a centre line radius less than the , internal pipe diamete

For branch pipe sizing based on System III the following sizing charts should be used.

Appliance	Dia. DN	Min. trap seal depth (mm)	Max. length (L) of pipe from trap outlet to stack (m)	Pipe gradient	Max. no. of bends	Max. drop (H) (m)
Limitations for unve	ntilate	ed branch	discharge p	ipes, syste	m III	
Washbasin, bidet (30mm diameter	30	75	1.7	2.2 <sup>1)</sup>	0	0
Washbasin, bidet (30mm diameter	30	75	1.1	4.4 <sup>1)</sup>	0	0

1) For maximum distances from trap to vent (see Figure 8 of BS EN

1205-2:2000).

2) If length is greater than 3m noisy discharge may result with an increased

risk of blockage.

3) Should be as short as possible to limit problems with deposition.

Sharp throated bends should be avoided. 4)

5) For slab urinal for up to 7 persons. Longer slabs to have more than one

outlet.

6) Swept-entry branches serving WC's.

7) Includes small potato-peeling machines

8) Tubular not bottle or resealing traps. 9) See Figure 9 of BS EN 12056-2:2000).

10) Every basin shall be individually ventilated.

11) Any number.

12) Spray tap basins shall have flush-grated wastes without plugs.

13) The size of ventilating pipes to branches from appliances can be DN 25

### Design Data - Rainwater

#### Basic Principles for Rainwater Designs

#### Sizing of rainwater installations

The following general guidelines are based on BS EN 12056-3:2000 Gravity Drainage Systems Inside Buildings – Roof Drainage, Layout and Calculations.

There are two factors to consider when calculating the rainwater flow from a roof, firstly the design rainfall intensity to be used and the effective roof area to be drained.

#### **Rainfall Intensity**

It is important to confirm the design rainfall intensity with the client before carrying out any design work; this can be done by calculation (refer to BS EN 12056-3:2000) or based on local requirements.

#### Effective Roof Area

Before the effective roof area can be calculated it is necessary to determine if the calculation will be affected by:

- a) Snow, (Section NB4, BS EN 12056-3:2000) details the design requirements for snow which should be taken into account.
- b) Wind, there is no requirement to allow for the effect of wind when designing a rainwater system for flat roofs or roofs protected from the wind by adjacent buildings. However, the wind and the roof slope can have the effect of increasing the flow of rainwater from the roof

of unprotected pitched roofs.

## Note: Flat roofs should be designed to allow for structural deflection under dead and imposed loads, BS 6229:2003, table 6 details the minimum finished falls for a flat roof dependent upon the roof covering.

C) Tall Buildings, when draining onto a lower level roof the effective catchment area of a wall should be taken as 50% of its area up to a maximum exposed height of 10m

The effective roof area can be calculated using the following formulae,

Flat roof	
$A(m^2) = L \times B$	where:
	A = Effective roof area (square metres)
	L = Length of roof (metres)
	B = Width of roof (metres)
Pitched roof	
$A(m^2) = L x (B+H/2)$	where:

A = Effective roof area (square metres)
L = Length of roof (metres)
B = Width of roof (metres)
H = Height of rood between eaves and

ridae	(metres)
nuge	(ineries)

If an adjacent wall is to incorporated into the equation then
the following needs to be added to the two formulae

0.5 (l x w)	where:
	L is up to maximum of 10m

#### Calculating design flow

Having determined the rainfall intensity (mm/hr) and effective roof area, A(m2), the following calculation is required to establish the actual design flow from the roof.

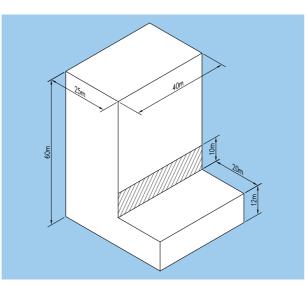

Flow rate,	$Q\left(l/s ight) =$	A(m2) x RI (mm/hr)
		3600

#### Example

A 20 storey residential block has a roof plan of 40m x 25m, there is also a podium level at level 3 with plan dimensions of 40m x 25m. The podium has been designed as a flat roof with a parapet around the perimeter. The roof will have a minimum slope towards the parapet, rainwater will discharge into a 50mm formed gutter

Local regulations have determined a design rainfall intensity of 75mm/hr.

Terrain domed PVCu outlets are to be installed on the main roof and flat grated outlets are to be installed at podium level. All outlets are to discharge into PVCu rainwater pipes.

#### Basic Principles for Rainwater Designs

### Step 1, Determine roof area to be drained and flow rate.

Main Roof Effective roof area		L x B) 40 x25) 000 m²
Flow rate	Q (l/s) =	A(m²) x RI (mm/hr)
		3600
	Q =	1000 x 75
		3600
	Q =	20.83 l/s
Podium Roof		
Effective roof area	$\begin{array}{c} A & = (\mathbf{A} \\ A & = (\mathbf{A} \\ \mathbf{A} \\ A$	L x B) + 0.5 (l x w) 40 x20) + 0.5 (10 X 40) 800) + (200) 000 m <sup>2</sup>
Flow rate	Q (l/s) =	A(m²) x RI (mm/hr)
		3600
	Q =	1000 x 75
		3600
	Q =	20.83 l/s

### Step 2, Determine No of rainwater outlets required.

The table below details the flow rates achieved through terrain rainwater outlets for a given head of water over the outlet during a 75mm/hr rainfall intensity.

Roof Outlet	Size (mm)		Flow capacit ec Head of v Outlet	
Part No.		30mm	50mm	100mm
2180.2	50	0.88	1.18	1.78
2180.3	82	2.12	2.52	3.21
2181.2	50	2.00	2.27	2.69
2181.3	82	2.1	4.89	7.22
2170.3	82	9.18	11.08	13.67
2170.4	110	9.29	14.11	18.22
2171.3	82	4.94	9.24	16.64
2171.4	110	5.17	9.95	24.18

To suit the design of the main roof 5 No 2171.3 outlets will be installed based on a flow rate of 4.94 l/s, (head over outlet 30mm). This allows for a total of 24.7 l/s to be collected and discharged from the roof.

To suit the design of the podium roof 4 No 2170 .3 outlets will be installed based on a flow rate of 9.18 l/s, (head over outlet 30mm). This allows for a total of 36.72 l/s to be collected and discharged from the roof.

### Step 3, Determine size of rainwater pipes required.

BS EN 12056-3:2000, Table 8 – capacities of vertical rainwater pipes, recommends the maximum design flow in vertical circular rainwater pipes.

Internal diameter of rainwater pipe (mm)	Capa RV (I/		Internal diameter of rainwater pipe (mm)	Ŕ٧	acity VP ′s)
	Filling Degree f =0.20	Filling Degree f =0.33		Filling Degree f =0.20	Filling Degree f =0.33
55	0.9	2.2	150	13.7	31.6
60	1.2	2.7	160	16.3	37.5
65	1.5	3.4	170	19.1	44.1
70	1.8	4.1	180	22.3	51.4
75	2.2	5	190	25.7	59.3
80	2.6	5.9	200	29.5	68
85	3.0	6.9	220	38.1	87.7
90	3.5	8.1	240	48	110.6
95	4.0	9.3	260	59.4	137
100	4.6	10.7	280	72.4	166.9
110	6.0	13.8	300	87.1	200.6
120 130	7.6 9.4	17.4 21.6	> 300	Use wyly- Eaton equation	Use wyly- Eaton equation

A filling degree of 0.33 shall be used unless national/local regulations and practice states that another filling factor should be used.

From our example, for the main roof we have chosen two number 110mm rainwater pipes collecting each collecting two rainwater outlets discharging a maximum of 4.94l/s. From The table above a 100mm internal rainwater pipe would be required (capacity 10.7l/s). Terrain 110mm PVCu pipework has an internal diameter of 103.6mm and is acceptable.

The podium roof will be collected and discharged through four number 110mm rainwater pipes each discharging a maximum of 9.18 l/s.

Note: where horizontal pipe runs are required, BS EN 12056-3:2000, table C.1 should be referred to, to ensure that the correct pipe size is chosen for the proposed gradient.

### **Fabrication Service**

#### Fabrication Service

#### **Pre-fabrication**

Shortage of skilled labour is just one reason for the growth of pre-fabrication within construction. Moving significant elements of the process from site to factory provides improvements in quality, cost and time predictability, productivity and safety.

With unrivalled expertise in PVC fabrication systems, our Fabrication Service has been helping specifiers and contractors overcome problems, both at the design stage and on site.

#### Specialists in fabrication

The Terrain Fabrication team works closely with our Technical Services Department, employing the latest design and manufacturing technologies.

Together, they produce high quality Pre-fabricated Stacks and Specials, either by making modifications to existing products from the Terrain range, or by conceiving components from scratch to deal with particularly awkward problems.

Where fittings are designed specially, CAD technology is used to provide accurate drawings, along with indications of all relevant dimensions.

Our fabrication team provides services in two key areas.

#### Standard specials

- These are produced by making slight modifications to existing Terrain products to suit frequently occurring design problems.
- These products tend to be required regularly, but in small quantities.
- Delivery lead time is usually the same as for standard catalogue items.

#### **Custom specials**

- These are designed and fabricated specifically to meet the unique design requirements created by special architectural features. They can be made not only on a one-off or small batch basis, but also in their hundreds, subject to the demands of your particular project.
- They can be produced to your precise specification in virtually any size or shape.
- Custom Specials provide solutions to otherwise unsolvable design problems.
- Delivery time depends upon the complexity of the design and number required.

#### Pre fabricated stacks

Prefab Stacks consist of soil and waste pipes and fittings pre-assembled at the factory to pre-determined lengths to provide a modular soil and vent stack.

These offer a number of benefits:

- Time and labour costs on site are reduced by minimising the joints to be made.
- Highly efficient for commercial, leisure and housing projects where identical plumbing arrangements are repeated a number of times.
- Can be quickly installed, reducing the need to re-locate residents, making them ideal for refurbishment work.

### Three easy steps for our special fabrication service

It couldn't be simpler to order Specials or have a Pre-fabricated Stack manufactured for you.

- Send a dimensioned sketch and specification by email, fax or post to our Technical Services Department.
- We will then advise you on design possibilities and send you back CAD diagrams, if necessary, complete with a part number and price for your approval.

If the special is being incorporated into the design stage of a drainage layout, be sure to include the unique part number with any plans to be passed to the contractor.

• You place the order through your local merchant, stating the unique product number and price.

Whether at the design stage or on site, should you come up against a problem related to plumbing and drainage, look no further than the Terrain Special Fabrication Service.
